49. Group Anagrams

Medium

Topics

Companies

Given an array of strings `strs`, group the together. You can return the answer in **any order**.

Example 1:

Input: `strs = ["eat","tea","tan","ate","nat","bat"]`

Output: `[["bat"],["nat","tan"],["ate","eat","tea"]]`

Explanation:

- There is no string in `strs` that can be rearranged to form `"bat"`.
- The strings `"nat"` and `"tan"` are anagrams as they can be rearranged to form each other.
- The strings `"ate"`, `"eat"`, and `"tea"` are anagrams as they can be rearranged to form each other.

Example 2:

Input: `strs = [""]`

Output: `[[""]]`

Example 3:

Input: `strs = ["a"]`

Output: `[["a"]]`

Constraints:

- `1 <= strs.length <= 104`
- `0 <= strs[i].length <= 100`
- `strs[i]` consists of lowercase English letters.

An Anagram is a word or phrase formed by rearranging the letters of a different word or phrase, typically using all the original letters exactly once.

Input:

```
strs = ["", ""]
```

Expected:

```
[["", ""]]
```

Where are the letters or words?

Approach

take out string

char array

sort it

convert to string

use this string as a key

then push all the related element to key

Hash table must be used, because this is a strings' question.

One tip: strings are anagrams \Leftrightarrow same string after sorting. No need for frequency count unless the string is super long.

Have a nice day!

It says: " You can return the answer in any order", but console result is:

Output

```
[["ddddddddddg","dgggggggggg"]]
```

Expected

```
[["dgggggggggg"],["ddddddddddg"]]
```

Why?

What does it mean "return all groups"? But the return result is vector? How can we return all groups? I mean, for example, we have such vector ["dog","cat","god","tac"]. What should I return?

I found nice solution in Java in the internet, and it worked. **However**, I really don't understand the question. It says

return all **groups** of strings that are anagrams.

i.e. if we have two groups of strings that are anagrams we have to return two groups of strings, i.e. we need `List<List<String>>`. But in the problem description the method signature is given by `List<String>`. Does it mean that we always assume that we have only one group of string every time? Can someone please clarify this for me?
